

Browse by Repository README

Adrian S. Wisnick, 11 May 2015

A. Two Mockups

There are two mockups. The first shows the starting Browse by Repository page. The second shows the sort list of repository results when a user selects a repository.

B. The starting Browse by Repository page

All the information is in or will be in the MODS records. The only exception is the number of items in the first column for each repository which needs to be auto-generated. The LCNAF (if available) appears as a URL in the MODS but should be presented as here (i.e., as an underlying link).

C. The sorted list of Repository results

Once users selected a repository, they would be taken to the page represented in the second mockup.

The table at right is exactly the same as the Browse by Standard Catalogue Record except that only the repository selected is shown. The columns in the full view of the table would be the same as the full Browse by Standard Catalogue Record (see mockups for that page).

The left side of the page should be self-explanatory. The “Return to Full Repository List” link would take users back to the original full table of repositories.

D. Lazyload

Only 10 or so records appear in both mockups for this page, but we'd like users to be able to continue scrolling down as needed.
